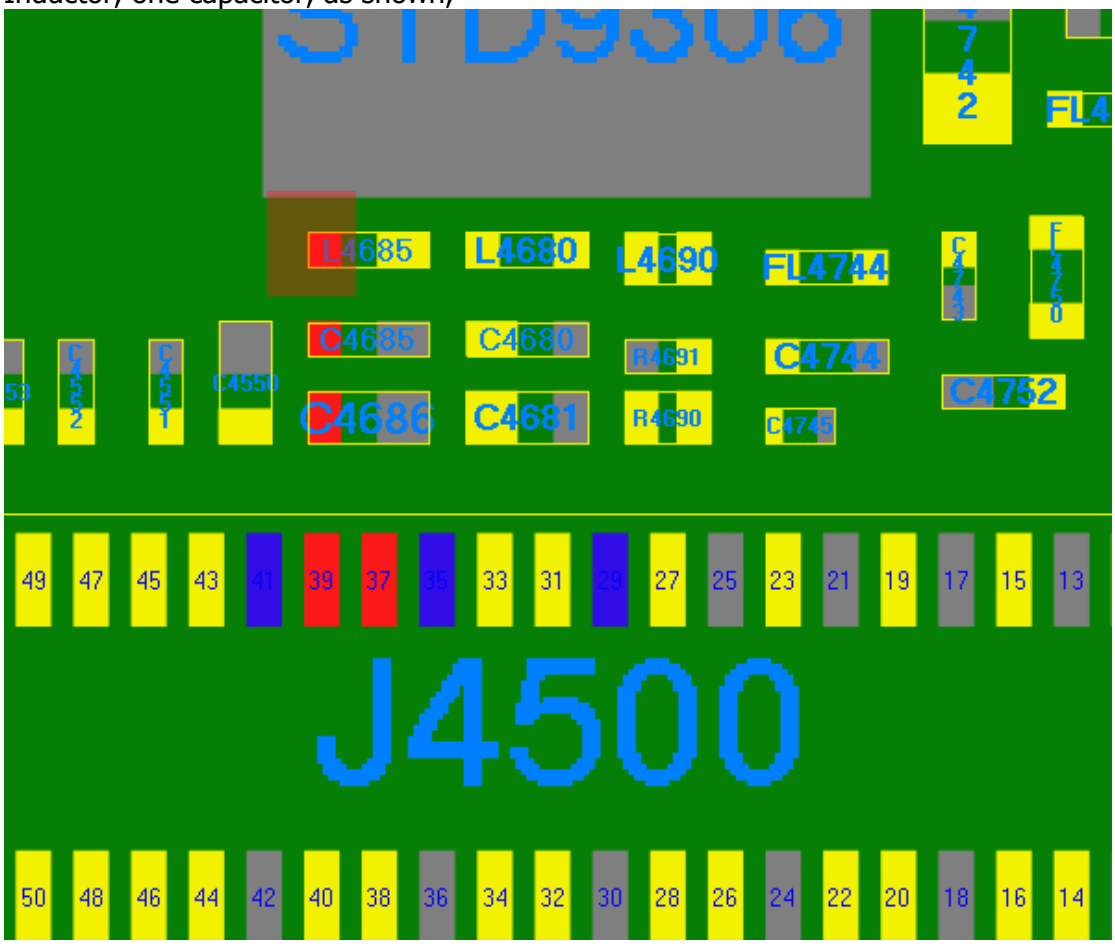
Today, I got the tablet of the customer's Apple air2 model. The fault is the water No Power ON.

Pressing the power button does not respond, there may be no battery, please check the charging cable to see if it can be charged, and then, no charging, it can only be connected to Adjustable Power supply, the current jump is normal, strange, No Power ON impossible Ah, remember, give priority to eliminating the external factors, open, and try to change a screen assembly, or no response, only carefully check the motherboard, because of the water, there is on the display side Two corroded, one

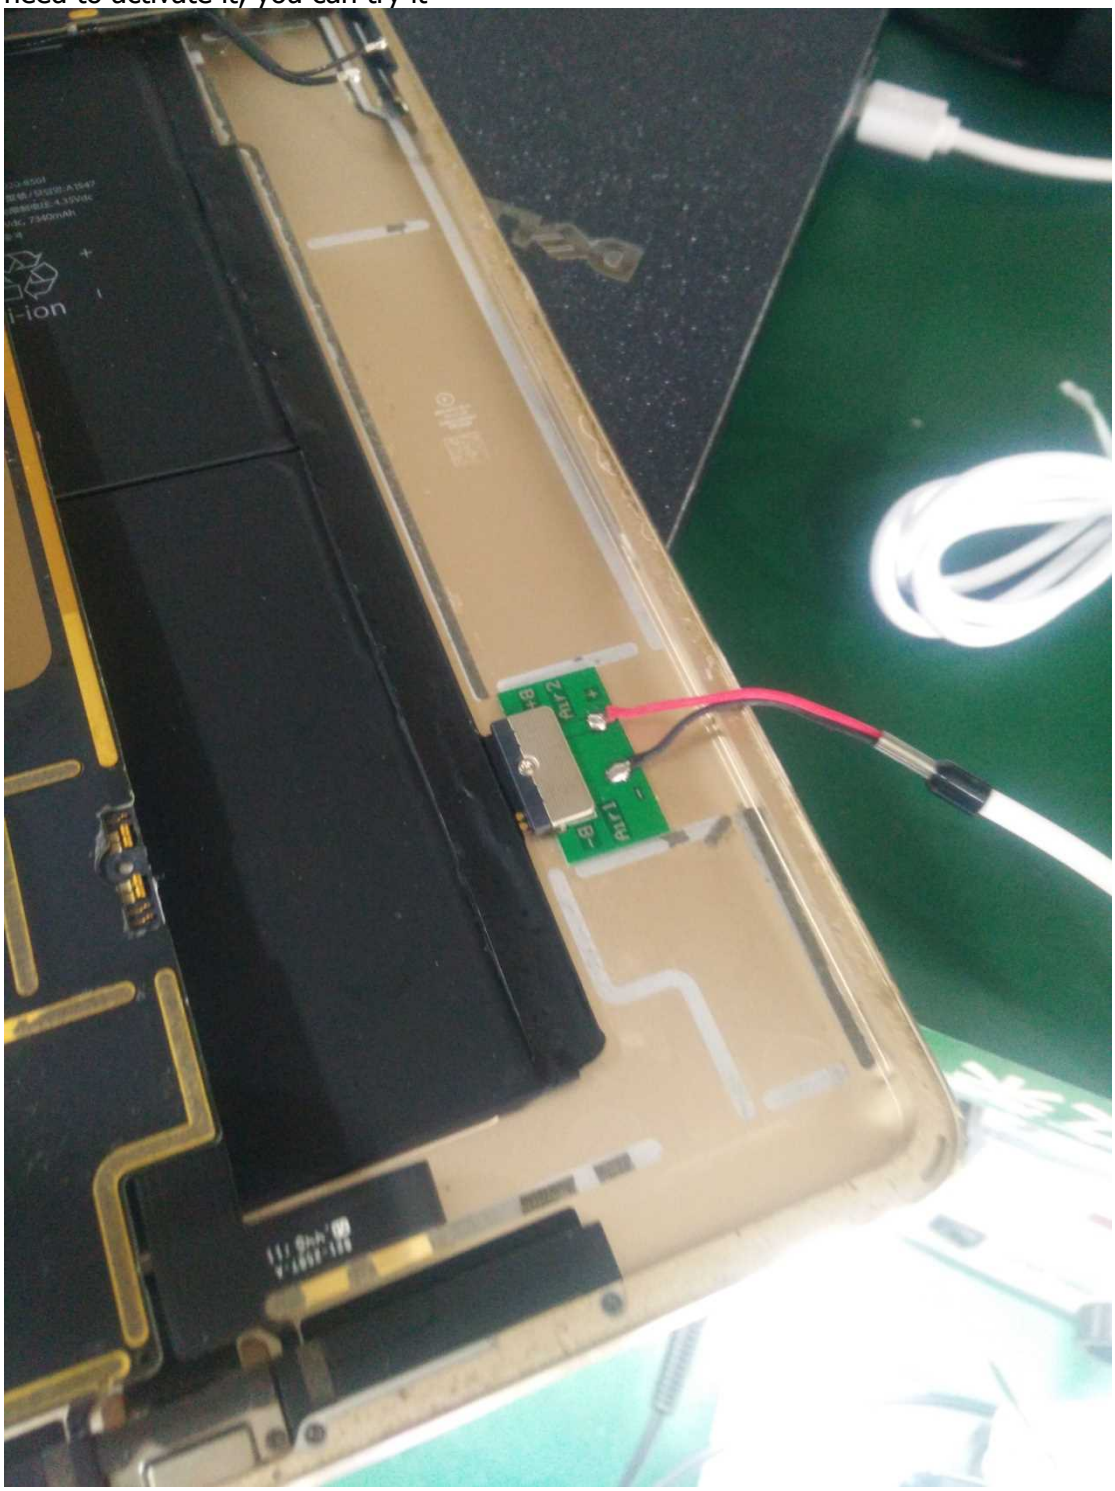
Inductor, one capacitor, as shown,



Clean, hit the ground value, infinity, disconnected, and Inductor shorted.

The screen is lit, is the battery broken?

The battery has not been used for a long time, there is no electricity, sometimes you need to activate it, you can try it



Charging with an activation card, useful,

Can be seen, the current has 2.53a, after charging for 2 hours, the normal boot, the repair is over.
