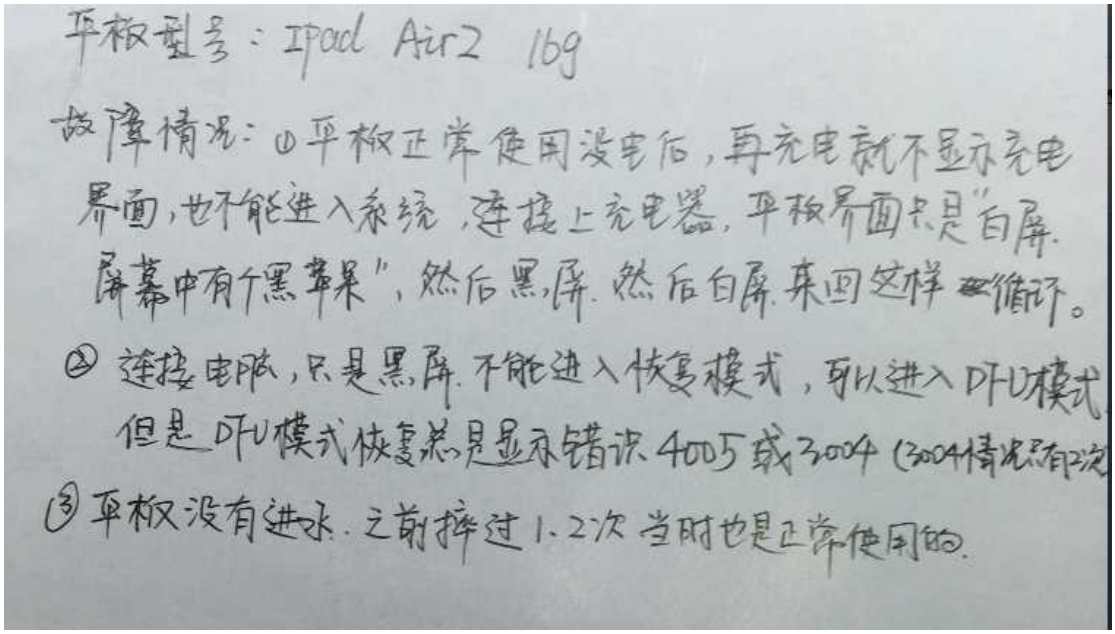
Spike ipad air2

Symptom: No Power ON

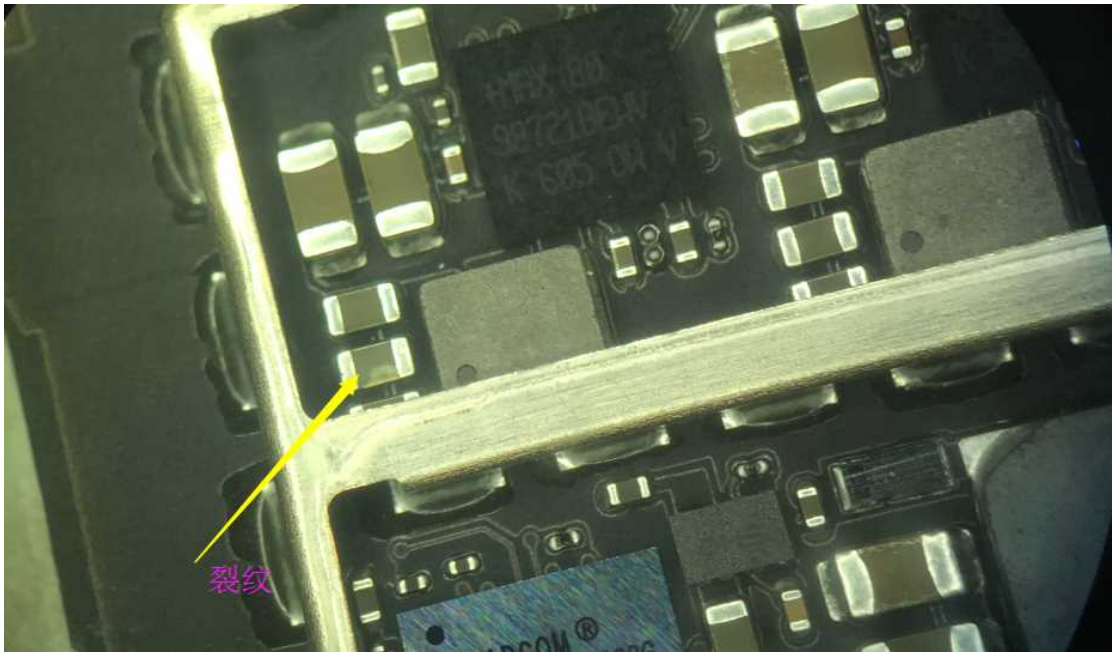
Client Description:



Repair process:

According to the customer's description, the Screen no display is turned on and the computer does not respond.The charger looks at the current to 0.4A and becomes 0.I suspect that there is a problem with the battery or there is a problem with the motherboard charging circuit.

After the motherboard is removed, the battery voltage is measured to be 4.2V.The test board found that the PPVBUS_PROTVCC was short-circuited and observed under the microscope that the capacitor C3263 burst.As shown



Directly tilted off, the diode value is tested normally.Power on and OK
